that bind specifically to, and modulate activity of HBSP are used to treat cancer and autolmmune diseases particularly of secretory or treat cancer and autolmmune diseases particularly of secretory or gastrointestinal tissue, e.g. cancer of salivary gland, thyroid, prostate, breast, gastrointestinal tract or pancreas, Sjorgen's syndrome, or caves disease, thyroiditis, insulin-dependent diabetes, pancreatitis, ulcerative colitis, Crohn's disease and atrophic gastritis. Host cells containing expression vectors comprising the HBSP nucleic acid are used to produce recombinant HBSP which is used to generate antibodies and to screen for its antagonists. Antibodies are useful directly as antagonists, to transport drugs to HBSP-expressing cells, to detect cells
                                                                                                                                                                    Parotid secretory protein; human; cancer; autoimmune disease; secretory tissue; gastrointestinal tissue; HPSP; Sjorgen's syndrome; Graves disease; thyroiditis; insulin-dependent diabetes; pancreatitis; ulcerative colitis; Crohn's disease; atrophic gastritis; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This DNA encodes a human parotid secretory protein (HPSP). that express HPSP, to monitor patients being treated with HPSP, and for purification of HPSP from natural sources. Expression of HPSP may indicate cell proliferation. HPSP nucleic acid or its fragments are used to detect HPSP-encoding sequences (optionally after amplification by PCR) by hybridisation, particularly for diagnosis and monitoring of disease,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  126 CANTGACCTAAGCAATGTCGTGGATAAGCTGGAACCTGTTCTTCACGAGGGACTTGAGAC 185

DNA of the invention, and is all so specifically stated as not being contained within the DNA of the invention. The DNA of the invention encodes the human parotid secretory protein (hPSP). The HPSP DNA is useful for chromosome identification and isolation of the corresponding genomic DNA. The DNA and protein can be used to detect abnormal levels of hPSP (in stendard blotting, amplification or immune assays), particularly for diagnosis of digestive, non-immune defensive, endocrine or immune system disorders. A particular application is diagnosis of cancers of the sallvary gland, thymus and pancreas which are associated with high levels of hPSP. The protein is also useful as antifungal, antibacterial, antibacterial, antibacterial, antipacterial, or calls expressing it, are used in screening tests to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 DNA. The protein, or cells expressing it, are used in screening tests to identify specific (ant)agonists, e.g. antibodies (Ab), polypeptides and antisense nucleic acids, which are potentially useful for treating conditions associated with excessive hPSP production. Cells containing the DNA are used to express the recombinant protein and this can be used to raise Ab, useful for diagnosis, therapy, for affinity purification and

This sequence represents an expressed sequence tag with homology to the DNA of the invention, and is all so specifically stated as not being contained within the DNA of the invention encodes the human parotid secretary protein (hBSP). The hBSP DNA is useful for chromosome identification and isolation of the corresponding genomic DNA. The DNA and protein can be used to detect abnormal levels of hBSP (in standard blotting, amplification or immuno assays), particularly for diagnosis of digestive, non-immune defensive, endocrine or immune
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     system disorders. A particular application is diagnosis of cancers of the salivary gland, thymus and pancreas which are associated with high levels of hFSP. The protein is also useful as antifungal, antibacterial, antibacterial antiparasitic and antiviral agents and may be expressed in vivo from the DNA. The protein, or cells expressing it, are used in screening tests to identify specific (antipagnists, e.g. antibodies (Ab), polypeptides and antisense nucleic acids, which are potentially useful for treating conditions associated with excessive hPSP production. Cells containing

This sequence represents an expressed sequence tag with homology to the DNA of the invention, and is all so specifically stated as not being contained within the DNA of the invention. The DNA of the invention of contained within the DNA of the invention. The DNA of the invention of the invention of concess the human parotid secretory protein (hPSP). The hPSP DNA is useful for chromosome identification and isolation of the corresponding genomic DNA. The DNA and protein can be used to detect abnormal levels of hPSP (in standard blotting, amplification or immune assays), particularly for diagnosis of digestive, non-immune defensive, endocrine or immune salivary gland, thymus and pancreas which are associated with high levels of hPSP. The protein is also useful as antifungal, antibacterial, of hPSP. The protein is also useful as antifungal, antibacterial, DNA. The protein or cells expressing it, are used in screening tests to identify specific (ant)agonists, e.g. antibodies (Ab), polypeptides and antibitions associated with excessive hPSP production. Cells containing the DNA are used to express the recombinant protein and this can be used to example the antibition and this can be used to example the protein and this can be used to express the recombinant protein and this can be used to express the recombinant protein and this can be used to express the recombinant protein and this can be used to express the recombinant protein and protein and the protein and protein and the protein and                                                                                                                                                                                                   New nucleic acid encoding human parotid secretory protein or its fragments - useful for diagnosis and treatment of, e.g. digestive and endocrine disorders and for drug screening
                                                                                                                                                                                                                                                                                                                                                                      Disclosure; Page 76-77; 94pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          to identify hPSP-binding proteins.

This sequence represents an expressed sequence tag with homology to the DNA of the invention, and is all so specifically stated as not being contained within the DNA of the invention and is all so specifically stated as not being encodes the human parotid secretory protein (IPSP). The hPSP DNA is useful for chromosome identification and isolation of the corresponding penomic DNA. The DNA and protein can be used to detect abnormal levels of hPSP (in standard blotting, amplification or immune assays), particularly for diagnosis of digestive, non-immune defensive, endocrine or immune system disorders. A particular application is diagnosis of cancers of the salivary gland, thymus and pancreas which are associated with high levels of hPSP. The protein is also useful as antifungal, antibacterial, and antiparastic and analysis and may be expressed in vivo from the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   DNA. The protein, or cells expressing it, are used in screening tests to identify specific (ant)agonists, e.g. antibodies (Ab), polypeptides and antisense nucleic acids, which are potentially useful for treating conditions associated with excessive hPSP production. Cells containing the DNA are used to express the recombinant protein and this can be used to raise Ab, useful for diagnosis, therapy, for affinity purification and

menas encoding secreted proteins. No ORF has yet been conclusively identified within the present sequence. The 5' ESTS were prepared from total human RNAs or polyA+ RNAs derived from 30 different Lissues. EST sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oliqo-dT primed cDNA libraries. Such ESTS are not well suited for isolating CDNA sequences cDNA sequences have been obtained, the full 5' UTR is rarely included. 5' ESTs are derived from mRNAs and even in those cases where longer used to obtain full length cDNAs with intext 5' ends and can therefore be used to obtain full length cDNAs and genomic DNAs. 5' ESTs are also used in diagnostic, forensic, gene therapy and chromosome mapping procedures. They are used to obtain upstream regulatory sequences and to design
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human; 5' EST; expressed sequence tag; secreted protein; cDNA isolation; gene therapy; chromosome mapping; ss.

This sequence represents an expressed sequence tag with homology to the DNA of the invention, and is all so specifically stated as not being contained within the DNA of the invention. The DNA of the invention of the invention of contained within the DNA of the invention. The DNA of the invention of the corresponding encodes the human parotid secretory protein (hPSP). The hPSP DNA is useful for chromosome identification and isolation of the corresponding openomic DNA. The DNA and protein can be used to detect abnormal levels of hPSP (in standard blotting, amplification or immune assays), particularly for diagnosis of digestive, non-immune defensive, endocrine or immune system disorders. A particular application is diagnosis of cancers of the salivary gland, thymus and pancreas which are associated with high levels of hPSP. The protein is also useful as antifungal, antibacterial, antiparasitic and antiviral agents and may be expressed in vivo from the DNA. The protein, or cells expressing it, are used in screening teach identify specific (ant)agonists, e.g. antibodies (Ab), polypeptides and antisonse nucleic acids, which are potentially useful for treating antisonse nucleic acids, which are potentially useful for treating conditions associated with excessive hPSP production. Cells containing the DNA are used to express the recombinant protein and this can be used to identify hPSP-binding proteins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New nucleic acid encoding human parotid secretory protein or its fragments - useful for diagnosis and treatment of, e.g. digestive and endocrine disorders and for drug screening
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Disclosure; Page 77; 94pp; English.

```
useful for chromosome identification and isolation of the corresponding genomic DNA. The DNA and protein can be used to detect abnormal levels of hPSP (in standard blotting, amplification or immuno assays), particularly for diagnosis of digestive, non-immune defensive, endocrine or immune system disorders. A particular application is diagnosis of cancers of the salivary gland, thymus and pancreas which are associated with high levels of hPSP. The protein is also useful as antifungal, antibacterial, antiparasitic and antiviral agents and may be expressed in vivo from the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    the DNA are used to express the recombinant protein and this can be used to raise Ab, useful for diagnosis, therapy, for affinity purification and
                                                                                                                                                                                                                                                                                                                                    DNA. The protein, or cells expressing it, are used in screening tests to identify specific (ant) agonists, e.g. antibodies (Ab), polypeptides and antisense nucleic acids, which are potentially useful for treating conditions associated with excessive hPSP production. Cells containing

                                                                                                                                                                                                                                                             The present sequence represents a nucleic acid molecule which encodes a secreted human protein. The gene number and the clone it was derived from are given in the descriptor line.

The invention relates to 31 novel genes and their fragments (nucleic acid sequences: AAA61260-A6129); amino acid sequences AAB12301-B12371) which are useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. Also pathological conditions can be diagnosed by determining the amount of the new polypeptides, in a sample or by determining the presence of mutations in the new polymolecides. Specific uses are described for each of the 31 polymucleotides, based on which tissues they are most highly expressed in and include products for the diagnosis or treatment of cancer, tumours, AIDS, autoimmune disorders, allergy, cardiovascular disorders, tumours, and include products for the genes are used to generate fusion proteins by linking to the gene a human immunoglobulin portion (AAA61251) for increasing stability of the fused protein as compared to the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human; digestive system antigen; gene therapy; cancer; appendicitis; ulcerative colitis; infection; Hirschsprung's disease; chronic colitis; digestive system disorder; Meckel's diverticulum; ds.

```

The present invention provides the protein and coding sequences of a number of human digestive system antigens. These can be used in the diagnosis, treatment and prevention of digestive system disorders, including cancer, Meckel's diverticulum, bacterial or parasitic infections, appendicitis, Hirschsprung's disease, chronic colitis or ulcerative colitis. The present sequence is a genomic DNA fragment encoding a digestive system antigen of the invention.
